

# Burndown

## Burndown Chart

Compared to last sprint, our burndown chart looks much better, work was started a much earlier leading to a less steep drop compared to last sprint. The flat part in the middle is due to dependencies being completed, and some new tickets were added, leading to that jump on the 15<sup>th</sup>. But overall, a very typical and expected chart.

## Velocity

The velocity of the sprint stayed around the same, it just increased slightly. We took around the same load of tickets as last sprint, but our increased familiarity with the tech stack and code allowed us to do a little more than last sprint.
